

# The ICRF-3: Proposed Roadmap to the next generation International Celestial Reference Frame

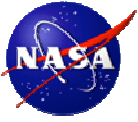

Christopher S. Jacobs,  
ICRF-3 Working Group chair  
*Jet Propulsion Laboratory, California Institute of Technology*  
On behalf of the IAU's ICRF-3 Working Group  
16 September 2013

# Overview of ICRF-3 Roadmap

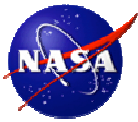

- Formation of ICRF-3 working group
- ICRF-2 history and benefits vs. ICRF-1
- Assessment of needed improvement in ICRF-3
- Plans for improving the ICRF
  - more uniform precision: VCS-II
  - more uniform spatial coverage: southern CRF
  - improved frequency coverage: K, X/Ka
- Gaia: radio-optical frame tie
  - Wavelength dependent systematic errors in CRFs

# Formation of IAU Working Group

- International Astronomical Union (IAU) is international governing body for the Celestial Reference Frame
  - ICRF1 accepted as fundamental CRF effective 01 Jan 1998
  - ICRF2 accepted as fundamental CRF effective 01 Jan 2010
    - Previously endorsed by IERS and IVS DBs
- Discussions were held at XXVIII GA of the IAU in Beijing concerning next generation ICRF
  - Discussions within Division I (now Division A) 'Fundamental Astronomy'
  - Organizing Group met in Beijing (Aug 2012)
  - Subsequent meeting in October in Bordeaux (Oct 2012)

# IAU ICRF-3 working group members

- Felicitas Arias, France
- David Boboltz, USA
- Johannes Boehm, Austria
- Sergei Bolotin, USA
- Geraldine Bourda, France
- Patrick Charlot, France
- Aletha de Witt, South Africa
- Alan Fey, USA
- Ralph Gaume, USA
- David Gordon, USA
- Robert Heinkelmann, Germany
- Christopher Jacobs, USA (chair)
- Sebastien Lambert, France
- Chopo Ma, USA
- Zinovy Malkin, Russia
- Axel Nothnagel, Germany
- Manuela Seitz, Germany
- Elena Skurikhina, Russia
- Jean Souchay, France
- Oleg Titov, Australia

[http://www.iau.org/science/scientific\\_bodies/working\\_groups/192/members/](http://www.iau.org/science/scientific_bodies/working_groups/192/members/)

## 1<sup>st</sup> ICRF-3 working group meeting

- Together with IAG Sub-Commission 1.4 (chair: Johannes Boehm)
- At Aalto University, Espoo, Finland (Mar 2013)

## IAERS Directing Board meeting

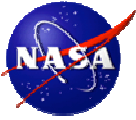

- IERS Directing Board meeting concerning Reference Frames (May 2013)

## 2<sup>nd</sup> ICRF-3 working group meeting

- At Observatoire de Paris, France (mid Sep 2013)

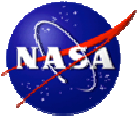

## Overview of 2<sup>nd</sup> International Celestial Reference Frame

Brief description of how the current ICRF-2 was realized:

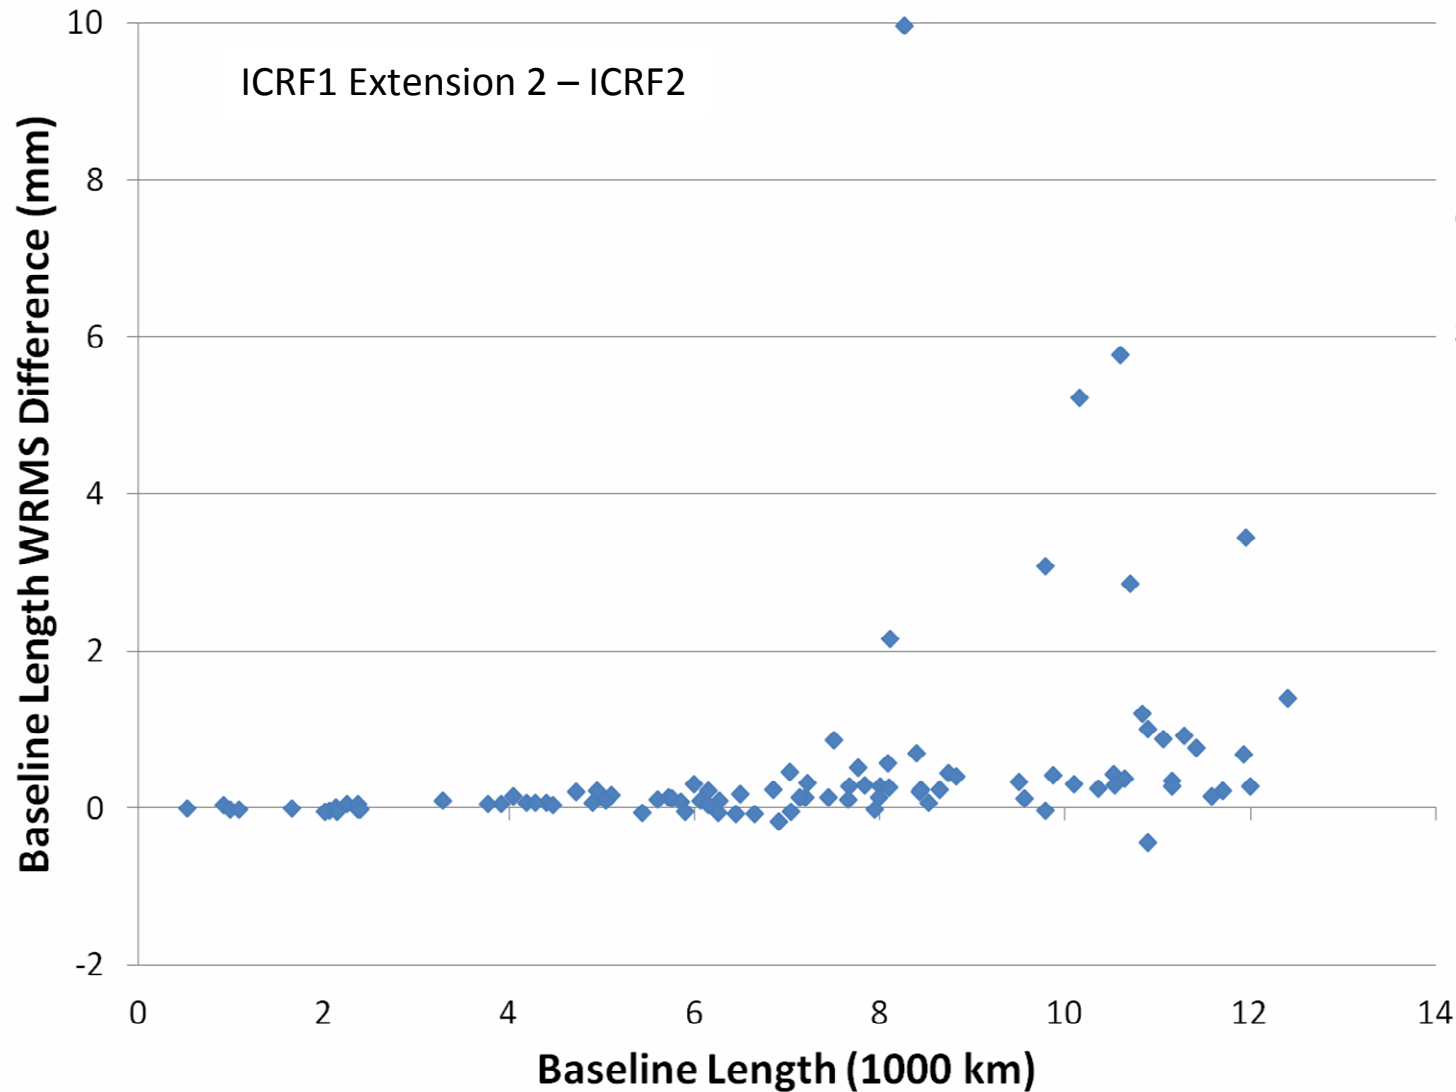

- S/X data (2.3/ 8.4 GHz or 13/ 3.6 cm) for 3414 sources
- 6.5 Million group delay observations 1979 to 2009
- No-Net-Rotation relative to ICRF-1
- Estimate TRF and EOPs internally from VLBI data  
Constrain to VTRF2008 (VLBI part of ITRF-08: *Böckmann et al, JGeod, 84, 2010*)  
as ITRF2008 was not yet released.  
4 constraints: Positions: No-Net-Translation, No-Net-Rotation  
Velocities: No-Net-Translation, No-Net-Rotation
- Produced from a single monolithic fit.  
Verified with solutions from various groups using independent software packages.

**Details in ICRF-2 Technical Note: Ma et al, IERS, 2009.**

## Geodetic impact by the switch from ICRF1-ext.2 to

Improvements  
can be found for  
baselines including  
southern stations!

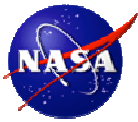

## Geodetic impact by the switch from ICRF1-ext.2 to ICRF2

Table: EOP differences w.r.t. IGS

EOP	ICRF1 Ext.2 fixed		ICRF2 fixed	
	WRMS	Chi2/dof	WRMS	Chi2/dof
x-pole	123.4	3.3	113.5	2.8
y-pole	113.3	3.1	109.6	2.9
X-pole rate	318.9	2.1	305.0	1.9
Y-pole rate	315.1	2.1	302.7	1.9
LOD	19.6	3.7	18.9	3.4

Courtesy of D. MacMillan, GSFC

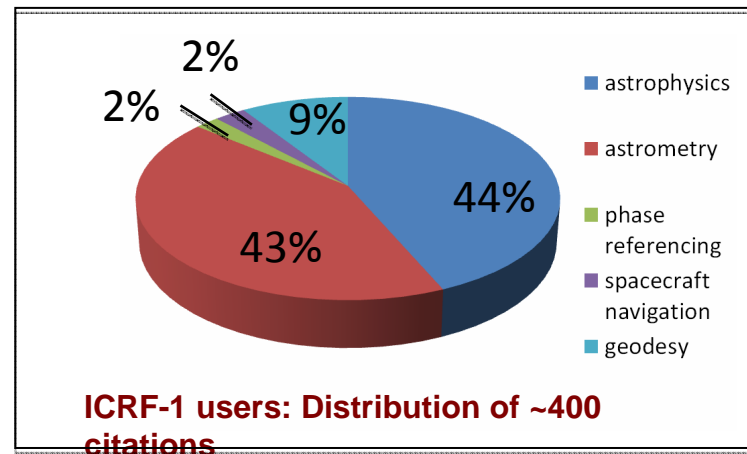

## All EOPs improved with ICRF2!

# ICRF-3 assessment of Needs

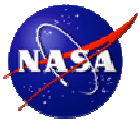

## Assessment of users for ICRF-3

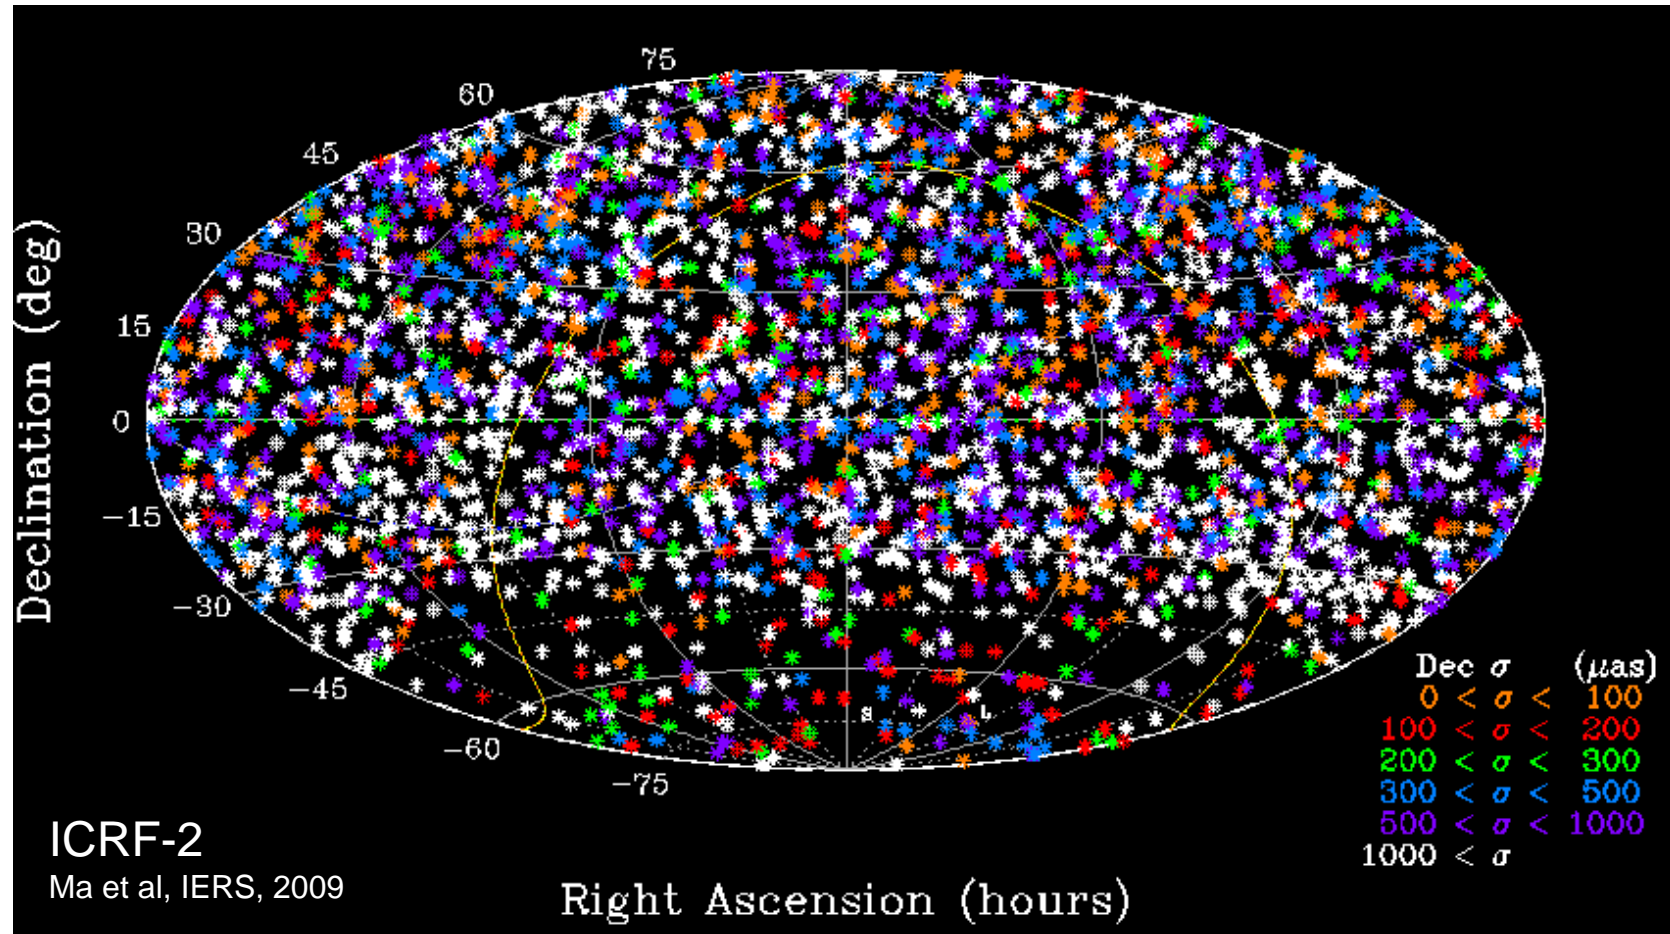

## Assessment of user relevant deficiencies

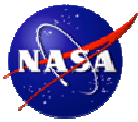

1. VLBA Calibrator Survey (VCS) is most (2/3) of ICRF-2  
but positions are 5 times worse than the rest of ICRF-2
  2. ICRF-2 is weak in the south especially below -40 deg Declination.
  3. High frequency frames have more point-like sources  
but also fewer sources at present.
- As with S/X, high frequency CRFs are weak in the south.

# S/X-band (2/8 GHz) ICRF-2

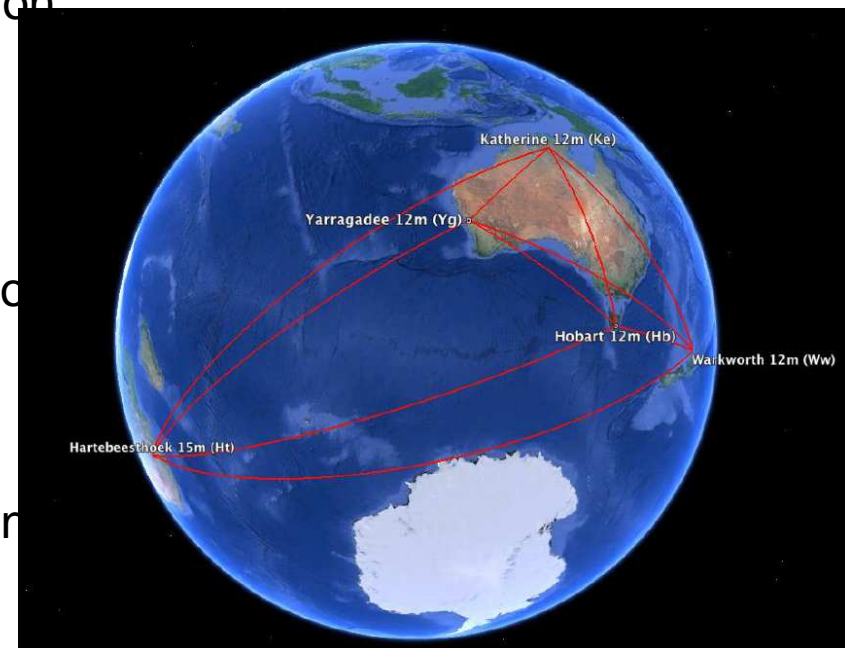

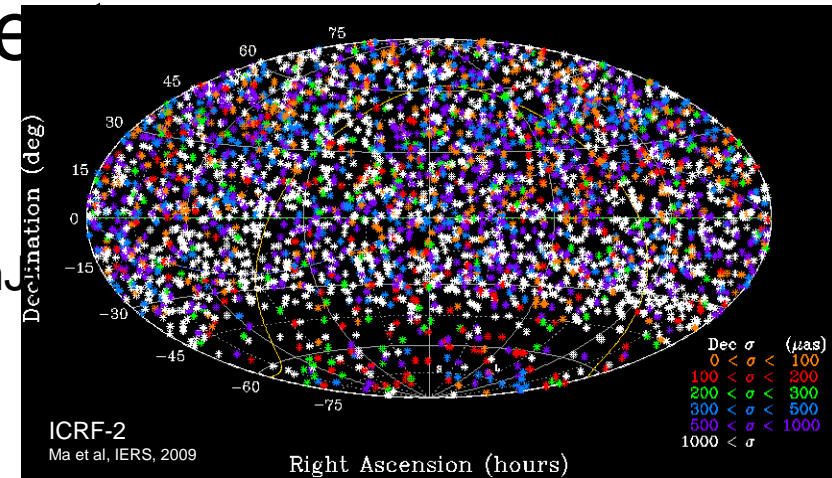

- 3414 Sources in ICRF2. Huge improvement over ICRF1's 608 sources
- ~2200 are single session survey sources (VLBA Calibrator Survey).

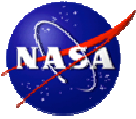

# S/X-band Plan for Southern Improvement

- Plans from Titov et al, IAG, 2013
- 2013-15: Observe 100-200 **strong** ( $> 400$  mJy) sources using the small, fast stations of the southern CRF Network at S/X-bands.
- Goal  $> 100$  scans per source,  $50 \mu\text{as}$  precision
- **Weaker sources** observed with large telescopes: Parkes, DSS45, Hobart26, HartRAO  
100-200 sources over 2 years,
- Goal 20 scans/source,  $100\text{-}150 \mu\text{as}$  precision

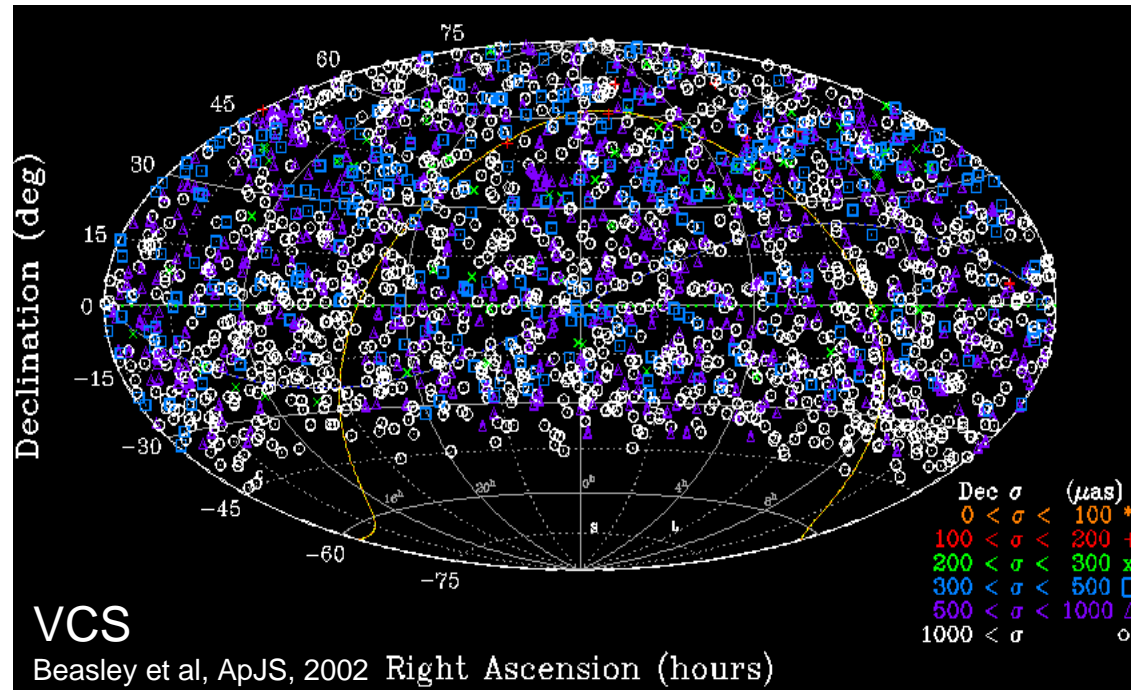

Southern Hemisphere CRF stations  
Credit: *Titov et al, IAG, 2013*

# S/X Survey sources (VCS)

- VCS precision is typically 1,000  $\mu\text{as}$  or 5 times worse than the rest of ICRF-2

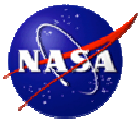

ICRF-2 Item	VCS	non-VCS	factor
N_src	2197	1217	VCS 1.8X better
median sessions	1	13	VCS 13X worse
median observations	45	249	VCS 5.5X worse
median time span	0	13 yrs	VCS arbitrarily worse
median RA sigma	621	130 $\mu\text{as}$	VCS 4.8X worse
median Dec sigma	1136	194 $\mu\text{as}$	VCS 5.9X worse

- **Deficiency: Uneven precision of ICRF-2 VCS's 2200 sources (2/3 of the ICRF-2)**

Plan: Re-observe VCS sources with VLBA

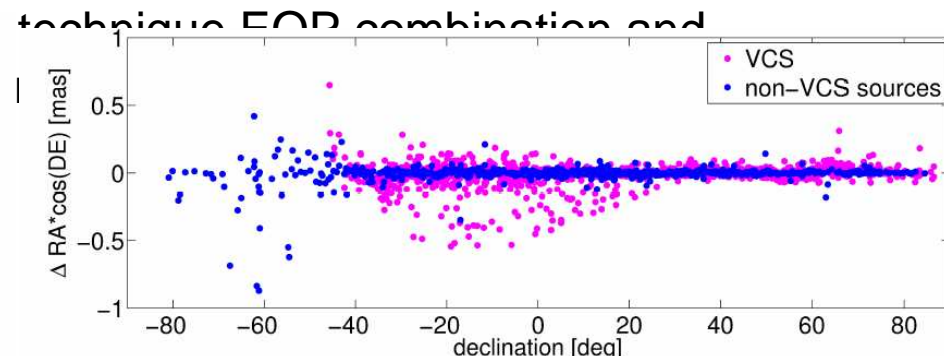

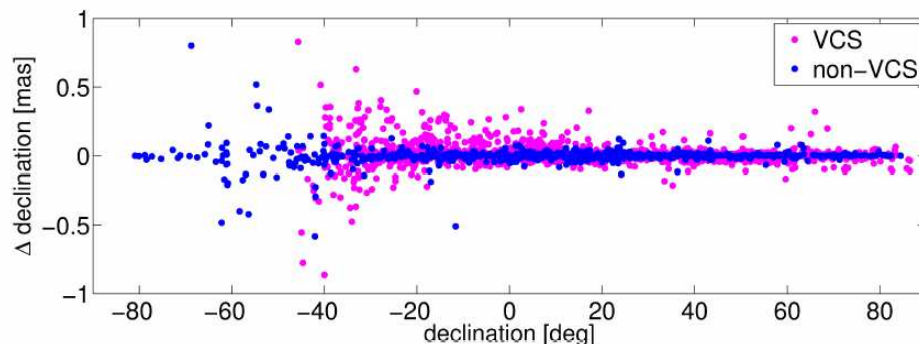

- VLBA approved 8 x 24-hour sessions to re-observe VCS sources.
- PI: David Gordon. First pass scheduled and waiting in the VLBA queue

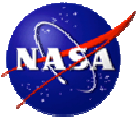

# Consistency between ICRF, EOP, and ITRF

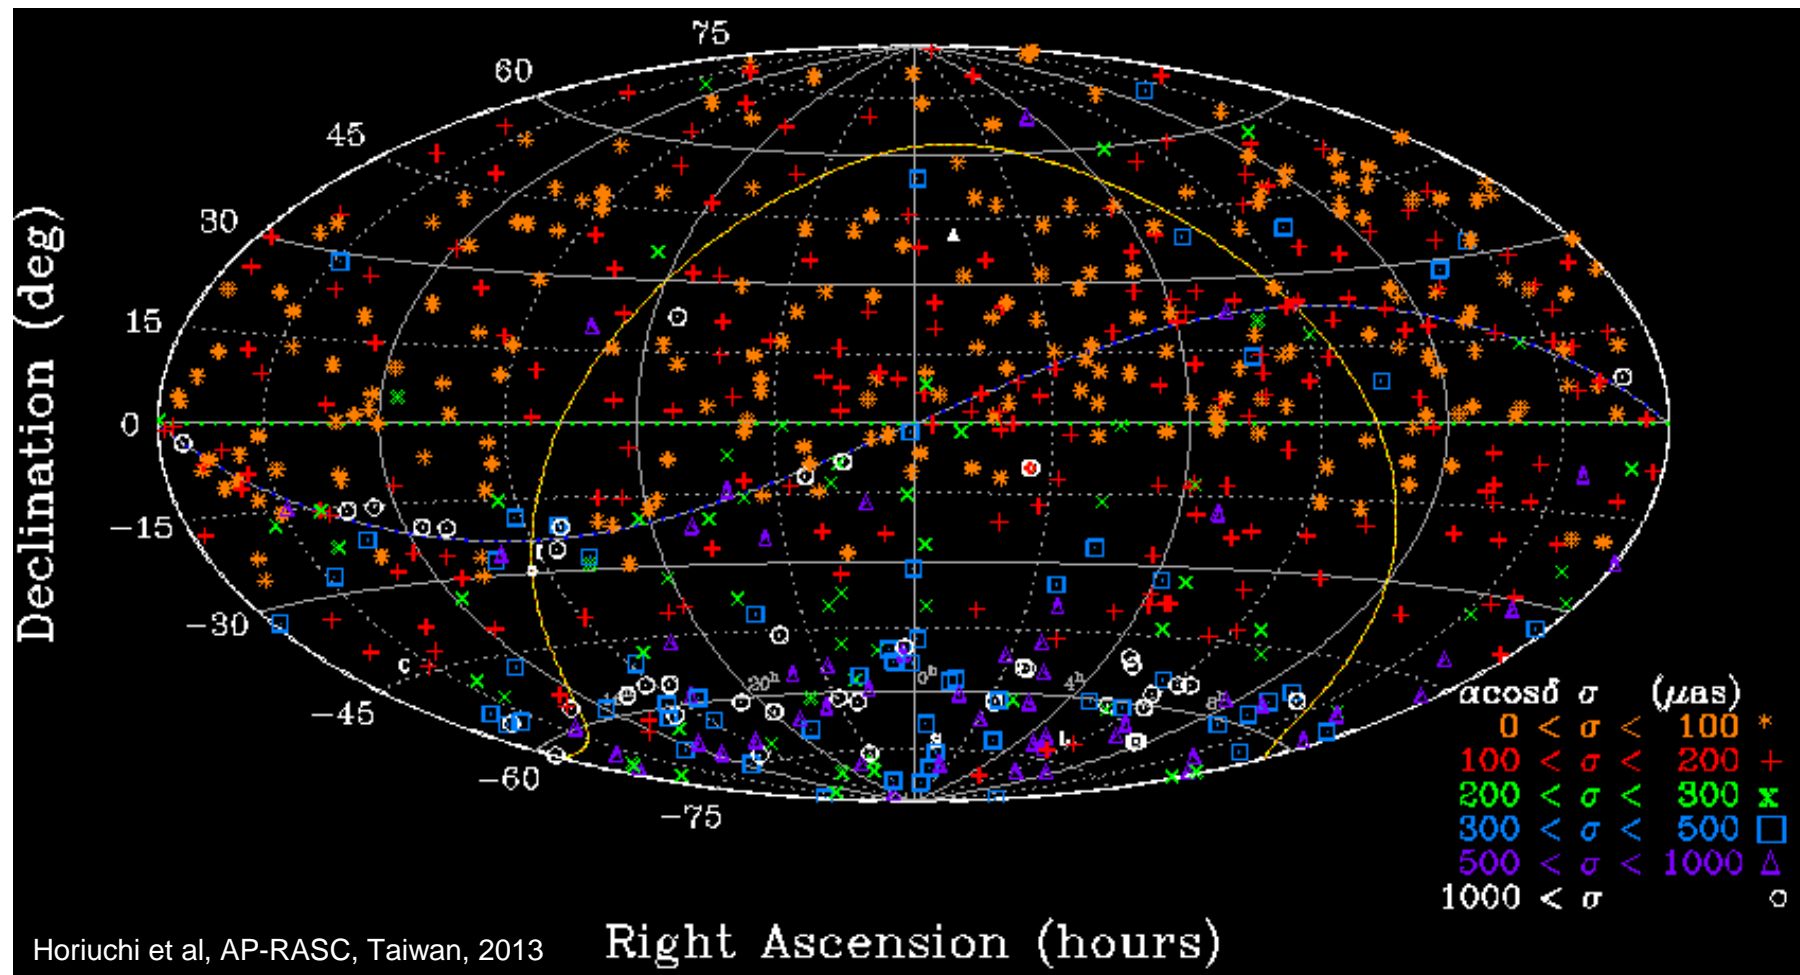

- IUGG Res. 3 (2011): „... highest consistency between the ICRF, the International Terrestrial Reference Frame (ITRF), and the Earth Orientation Parameters (EOP) as observed and realized by the IAG and its components such as the IERS should be a primary goal in all future realizations of the ICRS.”
- ICRF-2: consistency by NNR/NT constraints
  - CRF: NNR for defining sources, TRF: NNR/NT for datum sites, EOP: estimated
  - After the catalogue was determined it was rigidly rotated (small angles) onto ICRS
- ICRF3 WG started to investigate combinations of multiple VLBI solutions (cf. Bachmann, Iddink)
- The IAU WG ICRF-3 is starting to study EOP & TRF multi-technique combinations

- Plan: VCS-II collaboration of Gordon et al will re-observe VCS sources to re-sensitize their positions to EOP errors

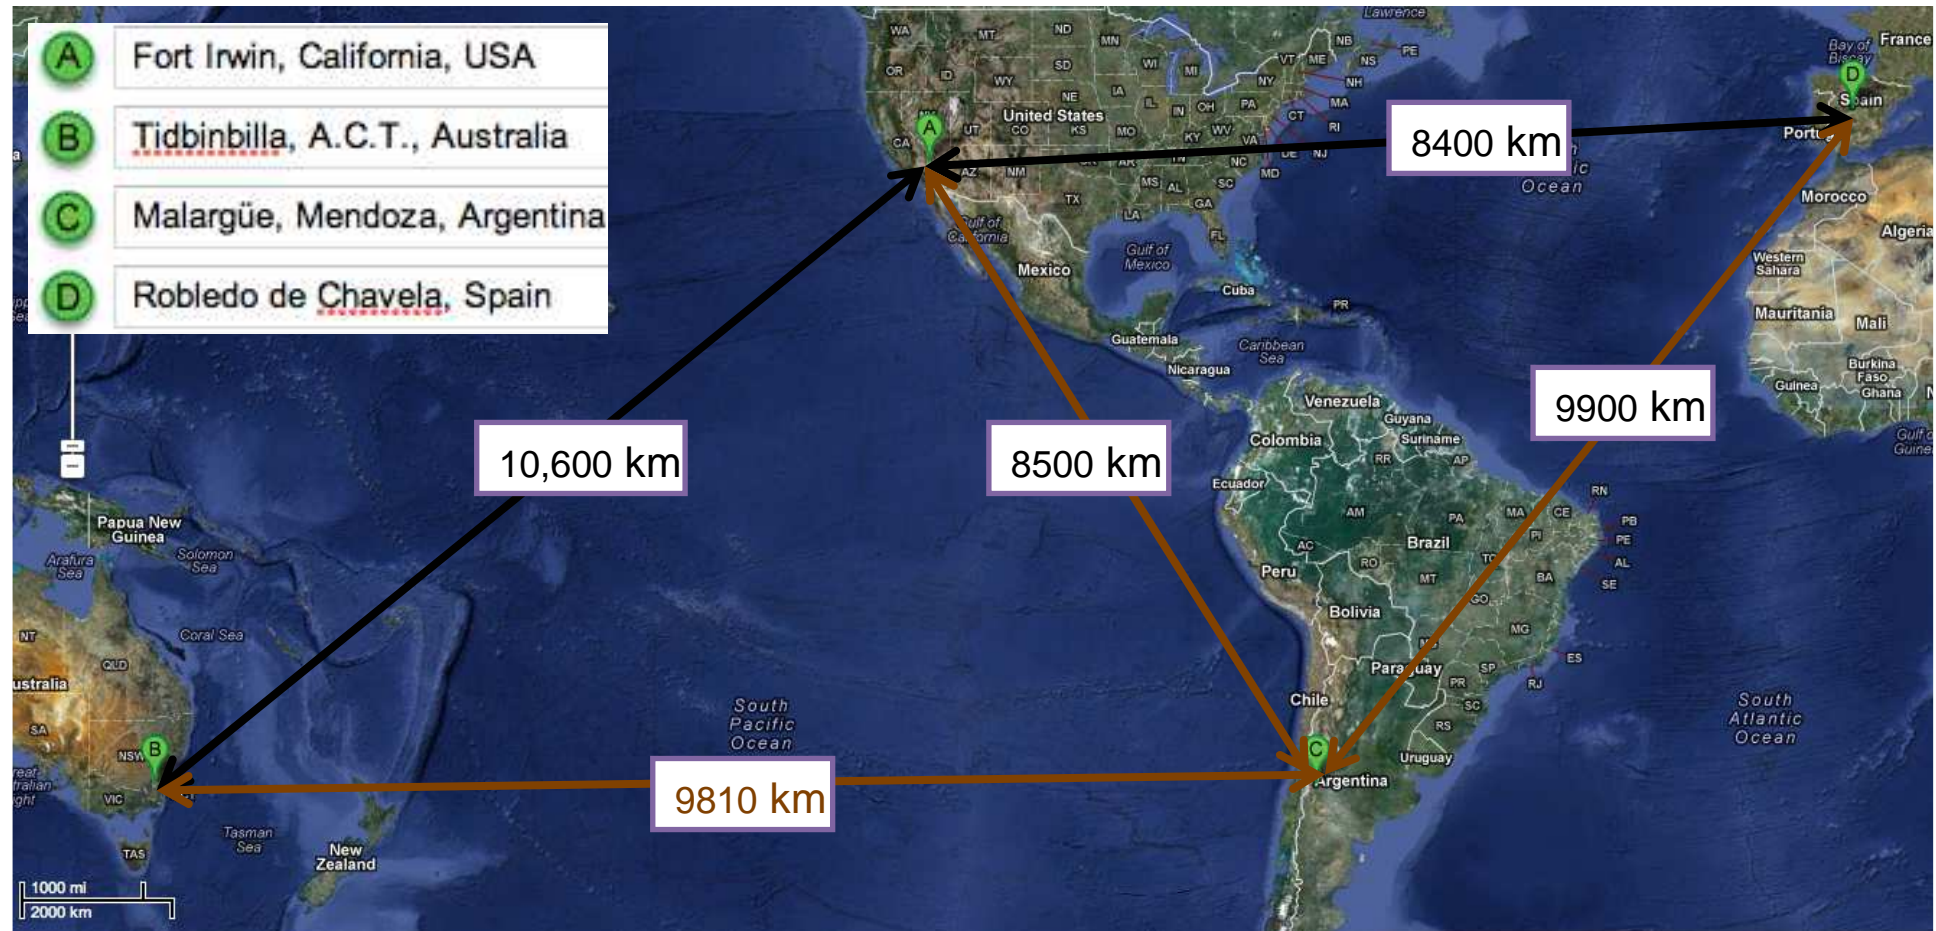

# X/Ka-band (8/32 GHz) CRF

- **Deficiency: Weak in the south.** S. cap 134 sources (dec < -45); 27 ICRF2 Defi
- **Full sky coverage (627 sources):** NASA baselines CA to Madrid & Australia  
+ recently added ESA Malargüe, Argentina to Tidbinbilla, Australia, PI: Jacob

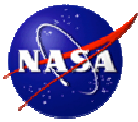

# Plan to improve X/Ka: baselines to Argentina

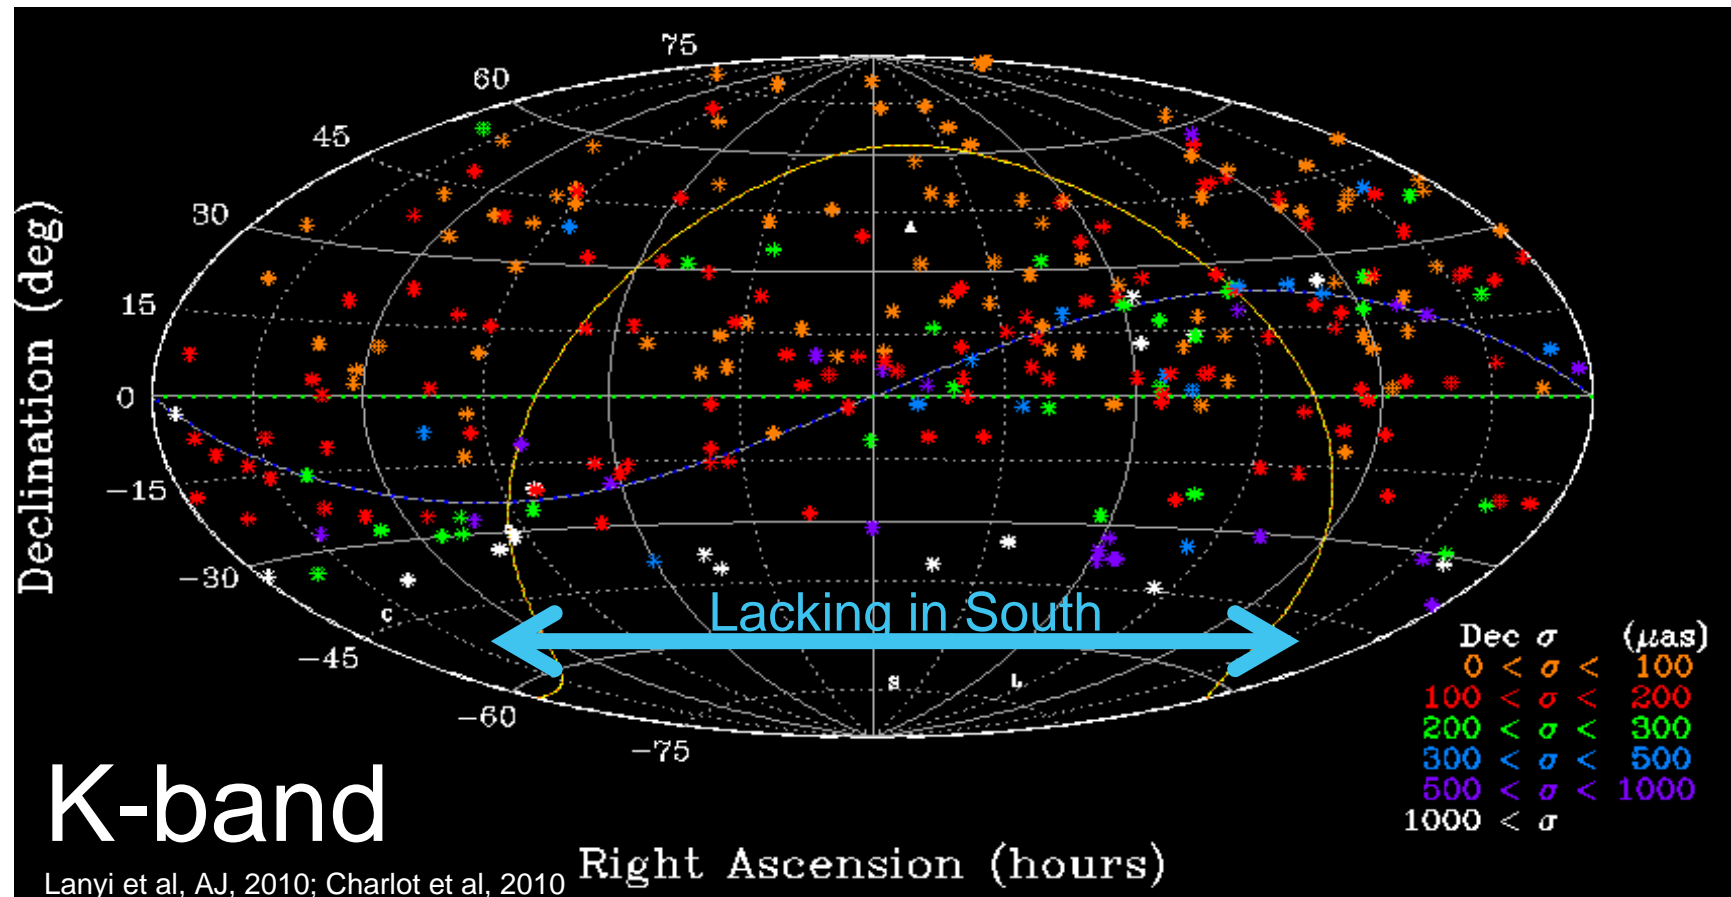

Maps credit: Google maps

ESA's Argentina 35-meter antenna **adds 3 baselines** to DSN's 2 ba

- Full sky coverage by accessing south polar cap
- near perpendicular mid-latitude baselines: CA to Aust./Argentin

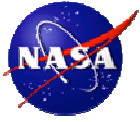

# K-band (24 GHz) CRF: 275 sources **JPL**

- **Deficiency: lacking in the south**

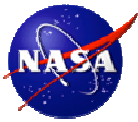

Plan: New K-band full sky coverage collaboration: *Bertarini et al.*, *de Witt et al*

- First 5h K-band session carried out (23 Aug 2013)
- First results will be shown at Journées in Paris, France (Sep 2013)

# **Gaia-Optical vs. VLBI-radio:**

## **Celestial Frame tie and Accuracy Verification**

# Gaia/VLBI frame tie & Accuracy test

## Gaia: $10^9$ stars

- 500,000 quasars  $V < 20$  mag  
20,000 quasars  $V < 18$  mag
- radio loud 30-300+ mJy  
and optically bright:  $V < 18$  mag  
~2000 quasars (*Mignard, this meet*)

- S/X frame tie Strategy:  
Bring new optically bright  
quasars into the radio frame  
(*Bourda, EVN, Bordeaux, 2012*)

- X/Ka frame tie:  
Measured X/Ka precision and  
simulated Gaia optical precision  
yields frame tie alignment of  
~ 10  $\mu$ as per 3-D rotation angle  
Limited by X/Ka precision, but  
improving as more data arrives.

- Titov *et al* are measuring optical  
properties for yet-to-be identified  
sources ('white' in figure to right)

<http://arxiv.org/abs/1305.3017> <http://arxiv.org/abs/1109.1034>

XKa: 136 optically bright counterparts:  $V < 18$ mag

(optical V magnitudes: *Veron-Cetty & Veron, 2010*)

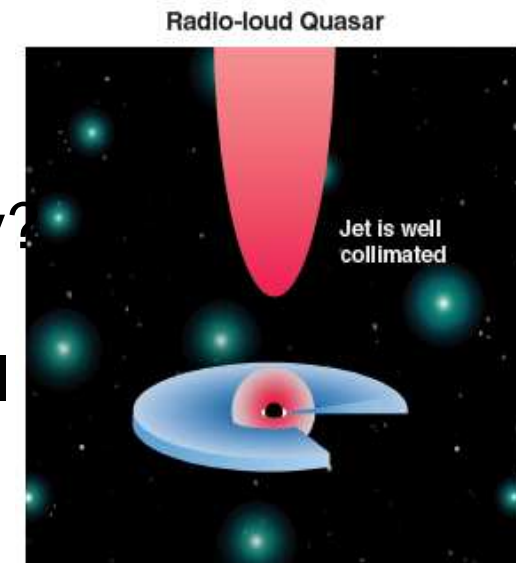

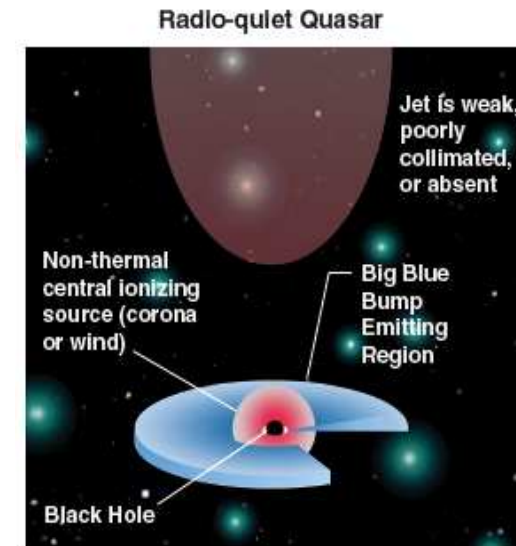

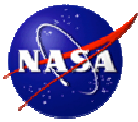

# Optical vs. Radio positions

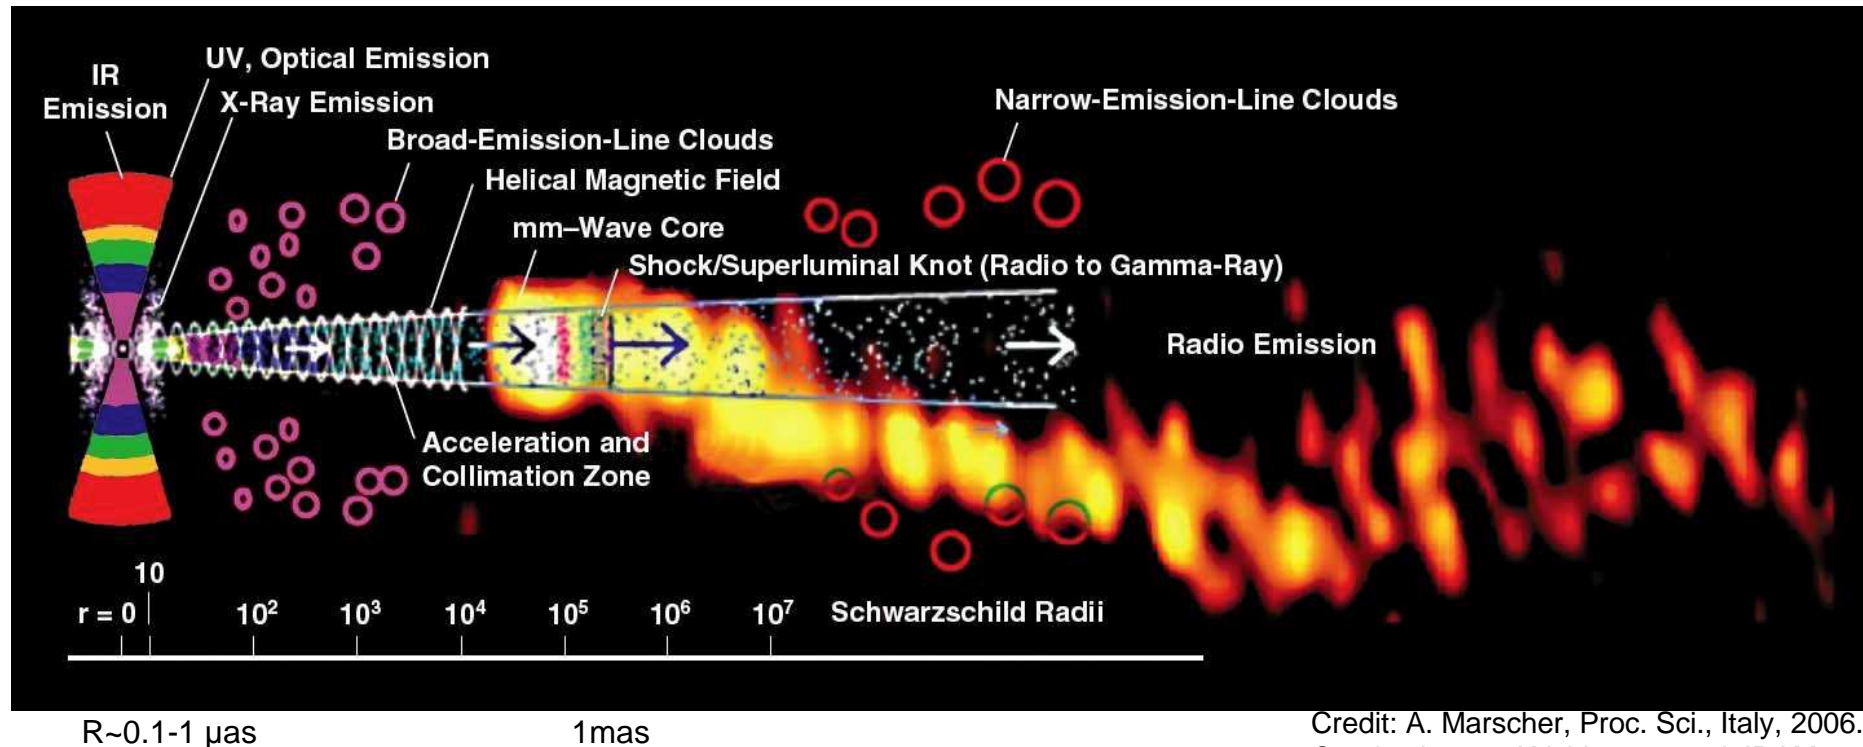

Positions differences from:

- Astrophysics of emission centroids
  - radio: synchrotron from jet
  - optical: synchrotron from jet?  
non-thermal ionization from corona?  
“big blue bump” from accretion disk?
  - optical centroid biased by host galaxy?
- Instrumental errors both radio & optical
- Analysis errors

# 9mm vs. 3.6cm? Core shift & structure **JPL**

Credit: A. Marscher, Proc. Sci., Italy, 2006.  
Overlay image: Krichbaum, et al, IRAM, 1999  
Montage: Wehrle et al, ASTRO-2010, no. 310

## Positions differences from 'core shift'

- wavelength dependent shift in radio centroid.

- 3.6cm to 9mm core shift:

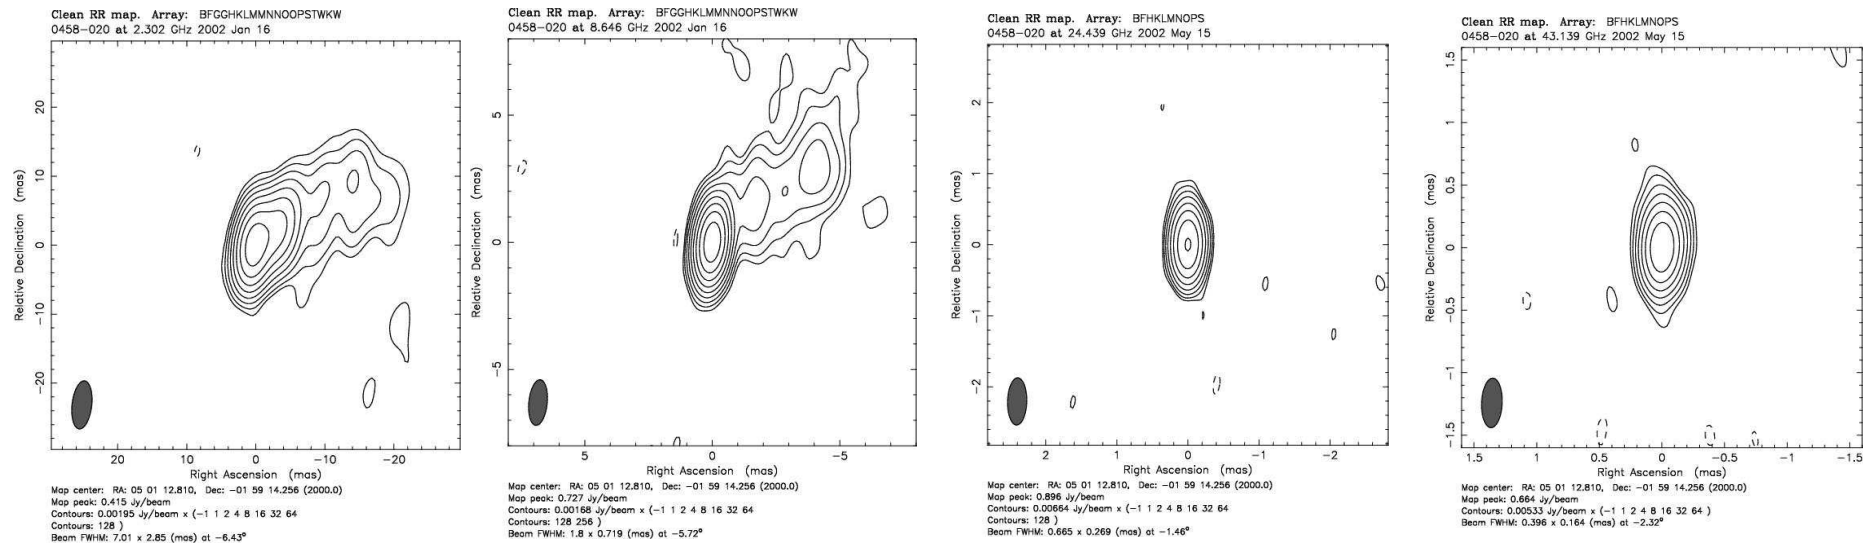

100  $\mu\text{as}$  in phase delay centroid?

<<100  $\mu\text{as}$  in group delay centroid? (Porcas, AA, 505, 1,

2009)

# Source Structure vs. Wavelength

S-band  
2.3 GHz  
13.6cm

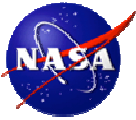

X-band  
8.6 GHz  
3.6cm

K-band  
24 GHz  
1.2cm

Q-bar  
43 GHz  
0.7cm

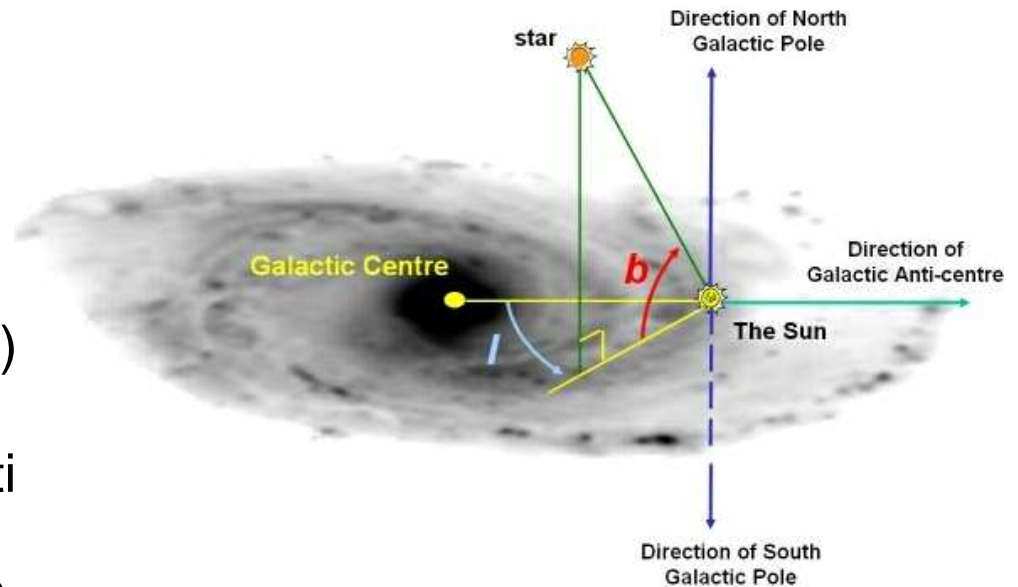

The sources become better -----> Ka-band  
32 GHz  
0.9cm

## Galactic Acceleration

- ICRF-2 is in the Frame of the Solar System Barycenter (SSB)
- SSB has **unmodelled** acceleration in direction of galactic center (200 Myr period around SgrA\*) plus other smaller accelerations
- SSB orbit *velocity* around Galactic center causes a large aberration which is mostly constant on decade scales  
**This is currently absorbed as ~constant distortion in reported positions.**
- SSB orbit *acceleration* causes changes of 5  $\mu\text{s/yr}$  (times projection factor)
- IAU's ICR**S** working group (**not ICRF-3 wg**) is charged with setting standard

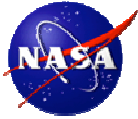

<http://astronomy.swin.edu.au/cosmos/N/North+Galactic+Pole>

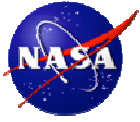

## Summary of ICRF-3 goals:

- Improving **VLBA Cal Survey's** 2000+ positions  
→ More uniform precision for all sources
- Improving **southern observations**  
→ More uniform spatial coverage
- Improving number, accuracy, and southern coverage of **high frequency frames** 24, 32, 43? GHz (K, X/Ka, Q?)  
→ Improved frequency coverage
- ICRF-3 completed by **Aug 2018** in time for comparisons & alignment with **Gaia** optical frame
- Competitive accuracy with Gaia ~ 70  $\mu$ as (1-sigma RA, Dec)
- Improving set of **optical-radio frame tie** sources for Gaia

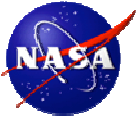

**Thank you for attention!**

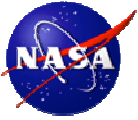

# Backup slides

# Status of VLBA

- Inclusion of VLBA observations made the most significant difference between ICRF and ICRF2
  - RDV experiments 24 hrs every 2 months (VLBA/
  - VLBA Calibrator Survey (VCS) sources
- VLBA needed to improve ICRF2
- VLBA at risk for closing
  - Judged as providing poor scientific return on dc
  - Definite risk for ICRF3
  - USNO providing financial support
    - VLBA EOP series
    - Continued CRF observations
    - Backup operations for USNO Correlator
  - IAU Division A, IVS and IERS DBs have written letters of support
  - Additional Partners welcome

## Charter for IAU Division A Working Group on the Third Realization of the International Celestial Reference Frame

The purpose of the IAU Division A Working Group on the Third Realization of the International Celestial Reference Frame (ICRF) is to produce a detailed implementation and execution plan for formulation of the third realization of the ICRF and to begin the process of executing that plan.

The **implementation plan** along with execution progress will be reported to IAU Division A at the XXIX General Assembly of the IAU **in 2015**.

Targeted **completion of the third realization** of the ICRF will be the XXX General Assembly of the IAU **in 2018**.

Derived from VLBI observations of extragalactic radio sources, the third realization of the ICRF will apply state-of-the-art astronomical and geophysical models and analysis strategies, and utilize the entire relevant astrometric and geodetic data set. The Working Group will examine and discuss new processes and procedures for formulating the frame along with the potential incorporation of new global VLBI arrays, and new observing frequencies offering the potential for an improvement over ICRF2. The Working Group will provide oversight and guidance for improving the relevant data sets.
